

What is the value of security? Contextualising the negative/positive debate

Review of International Studies has seen a debate over the *value* of security. At its heart this is a debate over ethics: about the extent to which security is a ‘good’ and whether or not security politics produces the kind of world we want. More recent contributions focus on the extent to which security is ‘positive’ or ‘negative’. However, this paper argues that the existing debate is limited and confused: key authors use the terms ‘positive’ and ‘negative’ in different and at times contradictory ways. The paper clarifies the roots of the existing debate, and then moves on to clear up the confusion by drawing out two different uses of the terms positive and negative: an analytic frame and a normative frame. In response, it proposes a pragmatist frame that synthesises the existing uses, drawing on pragmatism and practice-centred approaches to analyse the value of security in context. The contribution of the paper is thus twofold: it both clarifies the existing debate and suggests a solution. This is key because the debate over the value of security is crucial to thinking about how we want to live.

Introduction

Security is usually considered to be a ‘good’ thing. State representatives often use it to justify and legitimise policy choices – if anything, security is becoming *more* dominant as a theme in international politics. One of the peculiarities of the concept of security is its vagueness: it has long been recognised that ‘the term “security” covers a range of goals so wide that highly divergent policies can be interpreted as policies of security’¹. It has always had many contested and even contradictory meanings². Debates over the meaning of security have suggested that it is a ‘contested concept’: that it is essentially contestable by its very nature,

¹ Arnold Wolfers, *Discord and Collaboration* (Baltimore: Johns Hopkins Press, 1962), 150.

and that the very 'essence' or meaning of security is contested³. Alongside this broader conceptual interrogation, the field and the pages of this journal have seen a debate emerge over the *value* of security⁴. At its heart this is a debate over ethics: about the extent to which security is a 'good' and whether or not security politics produces the kind of world we want. So, the debate over the value of security is crucial to thinking about how we want to live.

However, the existing debate is limited. Traditional security scholars overlooked the normative dimension of security. Morgenthau⁵ and Wolfers addressed morality in security politics, and the latter also considered the ambiguities of national security politics, but even here security is considered to be 'nothing but the absence of the evil of insecurity, a negative value so to speak'⁶. Early peace studies engaged with ethics more directly, from the World Order Models Project to Galtung's theorising of positive conditions for peace⁷. But mainstream security studies and International Relations largely failed to advance these debates until the emergence of critical security studies in the 1990s. Here, some early contributions viewed security as a 'positive' value to be fought for, with a strong emancipatory agenda⁸. Arguing that being secure is a fundamental human need, they made

explicitly normative arguments about what security *should* be about. On the other hand, alongside this a growing number of authors emphasised the often problematic and exclusionary nature of national security politics, arguing that security is best avoided as it does not lead to desirable politics⁹. There is not enough space to detail the various contributions of critical security studies here, only to say that it has pushed research on security politics in important new directions. Although criticised for assuming there is a ‘universal security logic’,¹⁰ the field has produced further debate over what characterises ‘positive’ or ‘negative’ security politics¹¹, centred on what kind of world we can, or even should, strive for.

But this debate is itself confusing and unclear: authors use the terms ‘positive’ and ‘negative’ security in different, and sometimes contradictory, ways. This paper draws together and clarifies the contemporary ‘negative/positive’ debate that has been ongoing in the field and featured prominently in *Review of International Studies*. I divide the debate into two uses of the terms negative and positive. The first use is based on an analytical understanding of positive and negative, drawing on Berlin or Galtung’s respective distinctions between negative and positive freedom/peace. I label this the ‘analytic frame’: here negative security represents an absence of threat, while positive security represents further enabling conditions for human well-being. In the analytic frame, negative and positive security *work together* to produce a more complete security. The second use is based on a normative understanding of positive and negative, which tends to draw on securitization theory. I call this the ‘normative frame’: it makes a normative judgement aiming to understand when security is good or bad based on various theoretical criteria. Here, negative security is seen as something ‘bad’ to be

¹¹ See footnote 4.

avoided, and positive security is seen as something ‘good’ to strive for. Therefore, the normative frame suggests negative security should be *rejected* in favour of positive security (see figure 1 below).

	Analytic frame	Normative frame
Negative security	Absence of threat	Security in its bad form
Positive security	Security-plus	Desirable/good security

Figure 1: The contemporary debate

These frames draw on different literatures, but their differing meanings have been a source of confusion and have stalled the debate over the value of security. While they address the same issue – the value of security – they consider different aspects, and both approaches are useful. The analytic frame analyses gradations of security and the extent to which they provide security in a meaningful sense. The normative frame, meanwhile, recognises that not all security practices are desirable and tries to understand the normative consequences of particular security practices. Both are important endeavours, but we need to recognise that in some ways they are actually different projects and dividing them into two distinct frames will hopefully encourage this. Lastly, both the analytic and normative frames focus on establishing theoretical criteria to define positive and negative as opposed to analysing how security works in practice. As a result, they do not sufficiently recognise contextual variation in the value of security.

Having clarified the different uses of these terms, I propose an alternative approach to overcome these tensions, which I label the pragmatist frame. This brings the contributions of the analytic and normative frames together, but focuses on studying the value of security in context. This focuses on how security is currently used by different actors, to illustrate that it can be, but isn't always, a 'good thing'. Although there is not enough space to introduce a fully-fledged new theoretical framework here, the final section is devoted to exploring this further. Here I draw on the pragmatist philosophy of Dewey and James, practice-centred approaches and contextualism. Drawing on Ciută's argument that security does not have an unchanging 'essence' or meaning¹², I suggest that it also has no inherent value: this has serious implications for the negative/positive debate. If the value of security is contextual and unfixed, the focus should shift from defining what makes security practices positive or negative in the abstract, to studying actual situated security practices in context and using this to make conclusions about the value of security in that particular case. Reflexivity is essential here: such analysis has to be accompanied by a shift from fixed normative commitments towards normative *awareness*. This may in turn help practical analysis (and critique) of existing notions of security and security policy. While further research is needed, I hope this contribution will open space for exploring a new way forward for understanding the value of security.

The paper's central contribution is thus to clarify the debate over the value of security, drawing out the different uses of the terms 'negative' and 'positive' and proposing an alternative pragmatist route. Because the focus here is on the debate over the value of security and how security is currently used, it does not tackle the bigger question of what or which issues *should* or *shouldn't* be constructed as security issues, as this is beyond the scope of the

¹² Ciută, "Security and the Problem of Context: A Hermeneutical Critique of Securitisation Theory," 316.

paper. However, studying the ethics of security implies a normative approach, where the analyst/s is recognised as 'active participants in the security discussion'¹³. The paper begins with a discussion on the ethics of security, distinguishing between securitization and the construction of security. It then examines the negative/positive debate, drawing out the analytic and normative frames in the key contributions on the topic. Lastly, it develops the pragmatist frame drawing on these uses and building on them to create a pragmatic, contextual and practice-centred understanding of the value of security. The final section discusses the implications.

Debating the ethics of security

Critical security studies emerged in the 1990s as a critique of dominant state-centred security studies and politics, to question what security is and who it is for. Most authors writing in this tradition agree that the meaning of security is constructed. Consequently, critical security studies has engaged with ideas on the value and ethics of security directly, with two of the most influential early approaches presenting contrasting views. The Copenhagen School study security as securitization, viewing security as negative and usually best avoided¹⁴. Meanwhile, the Welsh School define security as emancipation, emphasising its positive value and potential¹⁵. Alongside this, there have been ongoing debates over the referent of security, including attempts to attach normatively positive adjectives to security to overcome the

negative aspects, from global security to human security, which have made important contributions¹⁶. These perspectives have provoked growing debate over the nature, or value, of security. While it doesn't use the language of the negative/positive debate, the Welsh School's understanding of security is closely aligned with the analytic frame, and is therefore discussed in more detail later. This section now turns to discuss the influence of the Copenhagen School's securitization theory on the negative/positive security debate.

Many of the contributions in the negative/positive debate explicitly use securitization as a starting point or even as shorthand for security. The Copenhagen School argue that issues 'become' security when a (usually elite) actor constructs them as such through security speech-acts and this designation is accepted by the relevant audience, moving the issue from the realm of politics and democracy into a realm of security where extraordinary emergency measures are enabled¹⁷. Securitization is seen to have 'inevitable negative effects', including 'the logic of necessity, the narrowing of choice, the empowerment of a smaller elite'¹⁸. The Copenhagen School argue that security cannot escape its traditional connotations because of how it is used in the field of practice: in historical terms, it *is* national security¹⁹. They view the realm of security as opposed to normal politics and based on these assumptions they argue that in most cases 'security should be seen as a negative, as a failure to deal with issues as normal politics'²⁰. As a result, they suggest that while securitization may sometimes be necessary most issues are best dealt with outside of the security sphere, or 'desecuritized'²¹.

¹⁶ The extent to which human security in particular should be considered part of critical security studies is subject to ongoing debate. There is not space to go into these debates in detail here, but a full discussion can be found in Edward Newman, "Critical Human Security Studies," *Review of International Studies* 36, no. 1 (2010).

²⁰ Ibid.

²¹ Desecuritization is under-theorised by the Copenhagen School, but is generally taken to mean shifting issues out of security politics and back into the sphere of politics. See Lene Hansen, "De-Securitization, Counter-Securitization, or Visual Insurgency? Exploring Security Discourses through Responses to the Muhammad Cartoons," in *51th Annual Convention of the International Studies Association* (New Orleans 2010).

The limits of securitization theory have been covered elsewhere so will not be dealt with in-depth here²².

Many more recent contributions to the negative/positive debate draw on securitization theory, but the debate suffers from a lack of distinction between ‘security’ and ‘securitization’²³. Following McDonald, I argue that securitization only represents a particular type of security construction. While arguing that ‘the meaning of a concept lies in its usage and is not something we can define analytically or philosophically according to what would be “best”’²⁴, Buzan et al. simultaneously limit the meaning of security to very specific usages by particular actors. Ciută discusses this in-depth, arguing that the Copenhagen School’s theoretical definition of security takes precedence over situated security practice, limiting analysis to how security works when situated actors ‘happen to act in theoretically prescribed ways’²⁵. Consequently, securitization theory neglects security when it doesn’t fit the framework, such as when it is framed using a different language of security that does not rely on friend/foe distinctions and non-democratic procedures. These do not enable emergency measures and are therefore not cases of securitization. Based on their definition of security, the Copenhagen School broadly favour desecuritization. However, in privileging a particular notion of ‘security’ that can only be articulated by those in a position of power, they overlook the ways in which other actors already contest dominant notions of security and threat, articulating

²² Roe, "Is securitization a negative concept?" provides an interesting critique relevant to this article. alternative, more positive, concepts of security²⁶. The Copenhagen School struggle to see security when it does not follow their rules. Therefore, I suggest that securitization theory presents a narrow, particular understanding of security, rather than *the* understanding of security.

While critical approaches to security have been concerned with both the politics and ethics of security they have tended to assume security has a universal logic²⁷. The emerging debate on the value of security presents a more nuanced perspective, exploring which characteristics or features make security negative or positive²⁸. Yet, as noted in the introduction, there are clear variations between key authors' definitions of 'negative' and 'positive' security and these differences are not addressed or made explicit. Some of this confusion is inevitable, reflecting the fact that different approaches have developed from distinctive literatures, focus on different dimensions of security and have different normative commitments. Most obviously some focus on security as a state of being, while others analyse security as a process or practice: those who focus on security as a state of being tend to be more optimistic about its positive potential, while those who study security as a process tend to point to the problematic features or consequences of existing security processes²⁹. However, the two are not always easy to separate³⁰, and few authors who focus on security as a state of being overlook security as a process. The different uses of these terms matters and needs to be acknowledged, since it stalls the debate as people talk at cross purposes. While recognising that security can be positive or negative, authors also continue to define what is negative and

²⁶ See, for example, Matt McDonald, *Security, the Environment and Emancipation: contestation over environmental change* (Abingdon: Routledge, 2012).

positive in the abstract. The debate over the value of security raises important questions about the kind of politics we desire. To move forward we need a common language, or at least open recognition when we are talking about different things. We also need to recognise that what is good usually depends on the context: this is discussed further in the final section.

The analytic frame: an absence of threat and ‘security plus’

The first common use of negative/positive security is based on an analytical understanding of the terms, drawing on Berlin and Galtung’s respective notions of negative/positive liberty and negative/positive peace, which are well established in the discipline. It conceives of negative security as the absence of threat, and positive security as the absence of threat *combined with* the presence of conditions furthering human ‘flourishing’ of some form. Positive security in this sense can be understood as ‘security plus’. This is analogous to the way that negative peace is about the absence of physical violence/war and positive peace is about the absence of war *plus* ‘the integration of human society’³¹. In the analytic frame, attaining negative security is about preventing threats from harming the wellbeing of the thing to be secured; in this sense negative security is essentially a lack, an *absence* of threat – this is why it is negative. Meanwhile, attaining positive security involves *both* protection from threat/s *and* the *presence* of conditions furthering active human ‘flourishing’ of some kind. Following this approach, being truly ‘secure’ is not simply about being safe from threats but has to involve also advancing towards some state of the good in which one has the means for active fulfilment. Thus, the analytic frame analyses gradations of security and the extent to which they provide security in a meaningful sense. So in this usage, negative security is not seen as a ‘bad thing’: it is negative because it represents an absence, and is therefore limited rather

³¹ See Galtung, "An Editorial," 2. "Violence, Peace, and Peace Research," *ibid.* 6, no. 3 (1969): 183.

than problematic. In this sense the analytic frame has strong ties to peace research and its attempts to understand peace as more than an absence of war.

Booth was the first to use this interpretation of negative/positive security, though without the explicit use of these terms. His seminal 1991 *Review of International Studies* article 'Security and Emancipation' defines security as the 'absence of threats' and emancipation as the enabling, positive concept: 'the freeing of people (as individuals and groups) from those physical and human constraints which stop them carrying out what they would freely choose to do'. Consequently, he concludes that 'security and emancipation are two sides of the same coin', and ultimately 'true security' requires more than an absence of threat – it requires emancipation³². In his 2007 book Booth expands on this to suggest that genuine security is more than survival: '[s]urvival is not synonymous with living tolerably well, and less still with having the conditions to pursue cherished political and social ambitions...In this sense, security is equivalent to *survival-plus* (the plus being some freedom from life-determining threats, and therefore space to make choices)'³³.

McSweeney presents a different interpretation, developing the first explicit notion of positive security. He draws on Berlin to distinguish between (negative) 'security' as equivalent to an absence of material threats, and the term 'to secure', arguing that the latter provides an alternative positive image which suggests 'enabling, making something possible' – here both images are necessary³⁴. He differentiates between 'security' as referring to the state level or image, and 'secure' as referring to the (positive) human/individual image³⁵. He argues that the human level has been ignored in favour of the state level and turns to sociology to argue

³² All from Booth, "Security and Emancipation," 319.

³³ Booth, *Theory of world security*, 102.

³⁴ Bill McSweeney, *Security, Identity and Interests: A Sociology of International Relations* (Cambridge University Press, 1999), 14.

³⁵ McSweeney, *Security, Identity and Interests*, 16.

that 'human needs encompass more than physical survival and the threats to it'³⁶. If you define security simply as the absence of material threats to the state, McSweeney suggests, you ignore 'much that is relevant to a policy designed to achieve security'³⁷. He develops the concept of ontological security to explain what it means to be secure for human beings, emphasising the 'security of social relations' relating to social order and 'the conditions which facilitate confidence in the predictability and routine of everyday social life'³⁸. However, external threats to the state also affect ontological security, so here positive and negative security work together to form a complete whole.

Other authors move between this notion of absence of threat/security plus and using positive and negative normatively. Roe draws on both positive/negative peace and freedom to explain his use of positive security³⁹. In much of his 2008 article on the subject he presents an understanding of positive security as being about 'having content' (security plus) – as opposed to an *absence* of threat. He draws on McSweeney, aiming to take his notion of positive security beyond human or individual security. He links positive security to (state) pursuit and defence of 'just values', arguing that the state can and should actively 'pursue positive security'⁴⁰ – but here it is not simply about the presence of positive conditions for human flourishing but about the type of foreign policy that is pursued by a state and the type of values that it represents/protects:

Whether we are pursuing 'freedom to' or 'freedom from', whether we are concerned with 'security' or 'securing', we are, in doing so, necessarily making a judgment that certain values must be maintained; that this has to be protected, that this is core. And many orders, including the international order after

⁴⁰ Paul Roe, "The 'Value' of Positive Security," *Review of International Studies* 34, no. 4 (2008): 777 and 79.

the 11 September terrorist attacks, make such judgements. Positive security is, in this way, the maintenance of just, core values⁴¹.

Of course, protecting and maintaining ‘just’ core values could be seen as ensuring or enabling human development and emancipation, which fits more neatly into positive security as ‘security plus’. However, here *both* negative and positive security involve a judgement about what kind of values to protect. This complicates what we mean by an ‘absence of threat’, as we are no longer talking about the mere survival of a referent object. This pushes beyond the analytic frame and is discussed further in the next section.

Hoogensen Gjorv also uses the terms positive and negative in this way. She draws on Berlin, noting that negative security equates to “security from” (a threat), and positive security to “security to”, or enabling⁴². She uses this to argue that positive and negative security can work together. She suggests that negative security tends to be associated with traditional security, whereas positive security is more useful as a critical tool to examine the gaps ignored by traditional (negative) security⁴³. Here, she links negative security closely with traditional state and military actors, and positive security with non-state and non-traditional actors, which makes sense in this usage of the terms. Like Roe, she is reluctant to reject negative security, suggesting negative security can involve values of justice too⁴⁴. She suggests that positive and negative security are conceptually distinct and involve different actors and different practices, which can be complementary. Overall, the idea of positive security as being more than a ‘lack’ or absence of threat is key in both Roe’s and Hoogensen Gjorv’s work. They both link negative security with survival and an absence of threat, and

⁴¹ Ibid., 793.

⁴² Gunhild Hoogensen Gjorv, "Security by Any Other Name: Negative Security, Positive Security, and a Multi-Actor Security Approach," *ibid.* 38, no. 04 (2012): 836.

⁴³ Ibid.

⁴⁴ Ibid., 845.

often specifically with state practices (including violent practices and the use of force), and they lean towards seeing it as complementary to positive security.

From this it is clear that in the analytic frame, whether positive or negative, security is generally considered to be a good thing. Here negative and positive can be used to measure the level of security in a given situation, with negative security representing a limited version of security where you are safe from threats and positive security providing additional opportunities. Together they provide a more complete security or even emancipation. Theoretical criteria are used to define what characterises negative and positive security, such as the actors involved, the practices they use, or the referent they focus on.

The normative frame: value judgements

The normative frame attempts to understand and analyse the normative consequences of different security practices and understandings of security. It uses positive and negative security as value judgements: here, negative security is seen as something 'bad' to be avoided, and positive security is seen as something 'good' to strive for. This category of usage is particularly tied up with securitization theory and normative critiques of securitization⁴⁵. Criteria are used to determine which characteristics, features or consequences define negative and positive security, respectively, based on the value judgements of the analyst (declared or otherwise). These could be attached to procedure: if particular security practices are undemocratic and I think that is a bad thing, then securitization or treating an issue as security in this way is negative from my perspective. Conversely, if other security (or even desecuritized) practices are more democratic or involve a larger number of actors, these practices are positive from my perspective. Value judgements can also be attached to the

⁴⁵ In particular, see Roe, "Is securitization a negative concept?"; Floyd, "Towards a consequentialist evaluation of security"; Floyd, "Can securitization theory be used in normative analysis?".

consequences or outcomes of security/securitization. Here, security is positive if the analyst deems the consequences of security/securitization to be 'good', and vice versa. Roe and Hoogensen Gjorv both use positive and negative in this sense at times, though Floyd has a more distinct usage so her approach is dealt with separately below.

In a 2012 article on the value of the concept of securitization, Roe draws on securitization theory and its critics to suggest that security has become seen as negative because of its processes (non-democratic, fast-tracked procedures) and its outcomes (reproduction of threat-defence, friend/enemy dichotomies)⁴⁶. Here negative security is not simply an absence of threat, but rather the *presence* of negative [read problematic], violent/undemocratic security practices and outcomes. He suggests this understanding of security rests on a narrow interpretation of both securitization and security, arguing that security can also be positive. Thus while recognising that security/securitization can be 'bad', he argues that it is not as negative as securitization theory suggests, and that different, more positive or 'good' constructions of security also exist. Here, then, negative and positive security are defined in the normative sense.

Turning now to Hoogensen Gjorv, as has been noted she generally distinguishes between negative and positive security in the analytic sense, viewing the two as different but complementary. However, in her association of the two terms with different actors, practices and characteristics, she shows a preference for positive security and at times suggests negative security can be problematic. In her approach, the role of actors is key – negative security is related to traditional militarised and state-centred security. It is hierarchical,

⁴⁶ For more on this, see Paul Roe, "Is Securitization a Negative Concept? Revisiting the Normative Debate over Normal Versus Extraordinary Politics," *Security Dialogue* 43, no. 3 (2012): 2.

rendering 'passive any possible agents of security outside of the state'⁴⁷. Meanwhile, positive security is understood as centred on trust, as 'multi-actor' with actors above and below the state as well as active referents. Thus rather than the concepts being complementary, in another description of the debate she suggests that negative security is 'security as a concept we wish to avoid, one that should be invoked as little as possible...on the other hand, security has also been known to represent something that is positively valued, or as something that is good or desired'⁴⁸. Here positive and negative security are distinct, not complementary, and one is clearly preferable. Expanding on this, she argues that negative security is about survival, and 'employs an epistemology of fear, focused on the identification of threats and the use of violence'⁴⁹, which is clearly much closer to the Copenhagen School's use of security/securitization. In this usage, Hoogensen Gjørsv explicitly distinguishes positive and negative by 'the epistemological foundations of each (fear or enabling), the security practices (violence vs. non-violence), and the actor (state or non-state) that is creating security'⁵⁰, which suggests positive security is preferable in most cases.

A different normative approach to judging the value of security has been developed by Floyd. She draws directly on securitization theory and takes an explicitly normative position on the terms, defining negative security as 'bad' and positive security as 'good', or 'just', in her later terminology. In earlier work she uses the terms positive and negative to describe 'how well any given security policy addresses the insecurity in question'⁵¹, focusing on the consequences of constructing an issue as security. Here, the value of security depends on whether there is an 'objective existential threat', and a 'legitimate referent object' (for Floyd,

it needs to be 'conducive to human well-being')⁵². In this way, securitizations are judged on their consequences. In later work, she turns to the language of moral philosophy to endorse 'human well-being as the highest value'⁵³. Again, she argues that security in itself has no value: rather, only the consequences of securitization matter and these can be judged as morally right or wrong depending on the extent to which they further human well-being. She usefully highlights the fact that the consequences of securitization are not always exclusionary⁵⁴. The consequences or outcomes differ in different cases, and it is these that matter.

However, her approach is closely linked with the Copenhagen School's distinction between the spheres of politics and security. As a result, Floyd suggests that a positive securitization is 'faster, better' and more efficient than politicization⁵⁵. She thus still subscribes to the Copenhagen School's binary distinction between security and political processes. Likewise, she continues the Copenhagen School's focus on elites as the 'speakers' of security⁵⁶. While she puts forward a clear and useful agenda to judge security by 'the maximisation of genuine security' (recognising that 'security is neither always positive nor always negative but rather issue dependent'), she nevertheless retains a narrow view of security heavily influenced by the Copenhagen School and predicated on theoretical criteria for what makes particular practices 'good' or 'bad'. Moreover, focusing on consequences neglects other factors which may affect the value of security, including security processes/practices and the number and type of actors involved, which as Hoogensen Gjørvi and Roe both highlight can affect the value, or desirability, of security and security practices.

From this, it is clear that negative security can be seen *either* as an ‘absence of threat’, a basic condition of survival, or normatively, as the presence of conditions or practices that we should avoid. Positive security, meanwhile, can be understood *either* as ‘security-plus’, an add-on to basic survival with the presence of further enabling conditions, or normatively as security in its ‘good’ form which we should strive for. Both frames have merits, particularly in starting a more nuanced discussion on the value of security. However, while both address the value of security and provide useful perspectives on this important issue, the dual use of the terms positive and negative makes the debate difficult to follow. It masks the different and important contributions of the analytic and normative frames: the former allows us to conceptualise security as a good on a sliding scale, from a more limited absence of threat to a more complete security-plus. The normative frame allows us to recognise that security politics can also be bad, as noted by a range of authors in critical security studies, not least the Copenhagen School. The dual usage of the terms also makes engagement between authors more difficult, which in turn makes it hard to move the debate forward. Lastly, both the analytic and normative frames focus on establishing theoretical criteria to define positive and negative. As a result, they do not recognise contextual variation in the meaning and value of security. With the exception of Hoogensen Gjørsv, the debate also continues the Copenhagen School’s focus on elites as the actors/speakers of security.

This paper now turns to suggest an alternative that overcomes some of these tensions. It brings the contributions of the analytic and normative frames together, but focuses on studying the value of security in context. Context is mentioned by the key authors in this debate but rarely elaborated upon or taken to its logical conclusions. Roe’s 2014 article draws on feminist work to emphasise context in positive security (here equated with

emancipation)⁵⁷. Hoogensen Gjørsv relates practice and context more closely to the negative/positive debate, arguing for a 'multi-actor, practice-oriented security framework'⁵⁸. However, she still largely delineates between positive and negative security based on which actors are involved. Floyd also suggests in earlier work that 'security is...issue dependent'⁵⁹. In her case however, this means looking at how security is used in practice by elite actors following specific criteria of securitization and judging the value on the outcome. Thus, existing approaches still rely on theoretical definitions as opposed to analysing how security works in context. The rest of this paper is devoted to exploring the possibility of using pragmatist, practice-centred and contextualist contributions to analyse the value of security by looking at how it is used in different contexts.

Towards a pragmatist frame

The alternative frame I propose bridges the analytic and normative frames but focuses on analysing how security is used in different contexts to gain practically useful knowledge⁶⁰. I retain the normative use of positive and negative as good and bad respectively, to recognise that security can be problematic, but use the analytic frame to suggest that while we cannot define what characterises 'good' or 'bad' security in the abstract, the 'goodness' of different security practices in a context should be understood on a spectrum. I call this the pragmatist frame, since it draws on the pragmatist philosophy of Dewey and James to shift the debate away from developing objective definitions or criteria for when security is good or bad and towards seeking practically useful knowledge about the value of security, which is contingent and context-dependent. Empirically, this lends itself to practice-centred analysis, and here I

draw on a wider notion of practice following Adler and Pouliot. Lastly, it brings in contextualism. Contextualist contributions on the meaning of security tell us that security means different things in different contexts, that it doesn't have an unchanging 'essence'⁶¹. The meaning and the practice of security is contested and produced through 'a process of negotiation'⁶². I suggest here that if security is contingent, it cannot be inherently good or bad. Rather, we can only understand the value of security by studying how it works and what it does in different empirical contexts. Bringing pragmatist, practice and contextualist literatures together and into this debate provides an important new lens through which to understand the value of security. While the space to explore the practical implications of this is limited here, the final parts of this section considers how the framework could be used to study the value of security and tackles some of the limitations and questions it raises.

Pragmatism is a philosophical approach drawing on the work of authors like John Dewey and William James. It has grown in popularity in IR⁶³ but remains overlooked in debates over security ethics⁶⁴. A pragmatic approach does not aim to uncover or produce an objective 'truth' that is 'out there', but rather to gain practically useful knowledge⁶⁵. Dewey and James are united in emphasising the importance of uncertainty and rejecting settled 'truths', 'fixed principles, closed systems, and pretended absolutes and origins'⁶⁶. They suggest instead that truth is contingent on context and experience, and never fixed: thus the 'quest' for truth is

⁶⁶ William James, "What Pragmatism Means," in *Pragmatism: A New Name for Some Old Ways of Thinking* (Cambridge Mass, 1907); John Dewey, *How We Think* (Boston, New York, Chicago: D.C. Heath and Co Publishers, 1910).

never settled. Cochran refers to this as a 'weak foundationalism' allowing contingent ethical claims⁶⁷. Following this, James emphasises a shift away from first principles and categories, towards last things and consequences – an idea or practice is 'good' if the results are deemed to be good, and only for as long as the results are deemed to be good⁶⁸. Ultimately, good ideas are ideas which 'are also helpful in life's practical struggles'⁶⁹ and the value of a thing depends on what that thing does or leads to in practical terms: what sensations, habits or actions it will produce⁷⁰. This will in turn vary in different cases and at different times. Dewey also emphasises practice and individual experience as necessary for ethical enquiry⁷¹.

Pragmatism thus suggests that to understand the value of security, we need to conduct detailed empirical enquiry to see how different actors use it in different contexts and how individuals experience it, asking what do different security practices *do*? What actions and habits do they produce, and how do they affect life experiences? While the answers to these questions remain contingent, a pragmatic contingent ethics allows us to suggest alternatives while emphasising reflexivity. We can therefore understand when security is good or bad *in a particular situation*. Methodologically, pragmatism emphasises abduction and starting at the middle level, instead of starting from abstract theoretical principles or inferring propositions from facts⁷². In this way, we can analyse when human beings experience security as a 'good' (and vice versa). This shifts the discussion away from the abstract potential of security to be 'good' or 'bad', towards empirical research analysing what it 'does' in different contexts.

⁷² See Friedrichs and Kratochwil, "On Acting and Knowing: How Pragmatism Can Advance International Relations Research and Methodology," 709.

The way in which pragmatism is used here lends itself to practice-centred analysis. Practice-centred approaches study practices and how they (re)produce particular ideas and realities⁷³. Here I draw on a wider notion of practice following Adler and Pouliot, which fits more logically with pragmatism. Thus ‘practice’ includes discursive practices as well as ideas, power relations, policies and physical practices undertaken in the name of security⁷⁴. Vitrally, practices are distinguished from behaviour or actions because they are ‘socially meaningful patterns of action’⁷⁵. A wider understanding of practice allows us to study a range of security practices and processes, including contestation and resistance to hegemonic security practices. This means that we can study a range of actors beyond elites, while recognising the importance of power. Pragmatism is vague on research methods but practice approaches can provide a clear toolkit for how to study security in a way that is compatible with a pragmatic approach⁷⁶. It also gives us an empirical starting point: security practices.

Combining pragmatism and the practice turn provides a fruitful way forward for understanding and studying the value of security in context. Here I draw on the contributions of contextualist arguments on the meaning of security, most notably Bubandt, Ciută and McDonald. Bubandt’s vernacular security draws on anthropological methods to propose ‘a bottom-up, actor-oriented’ analysis of how security is created which recognizes that ‘security is conceptualized and politically practised differently in different places and at different

⁷³ Common approaches draw on Bourdieu or Latour’s Actor Network Theory: for an overview, see Christian Bueger and Frank Gadinger, *International Practice Theory: New Perspectives* (Palgrave Pivot 2015). The practice turn has been more influential in critical security studies, where it is usually associated with what is termed the Paris School, and authors like Bigo. However, while such studies make important contributions to critical security studies they focus primarily on state or government security practices and tend to remain critical of security processes.

times’⁷⁷. Ciută argues that while a contextual approach privileges how the actors studied define and practice security, it also ‘engages the contradictions and normative consequences of contextual definitions of security’⁷⁸. Contextualising the study of security has normative implications. Crucially, if we take it to its logical conclusions, a contextualised and conceptually open study of security necessitates an empirical focus: but if we focus on how actors use security, we may end up ‘foreclosing alternative political horizons’⁷⁹. Ciută’s answer to this problem stresses understanding normative awareness as inherent to contextualized analysis of security: at the end of the day ‘normative judgements are inherent in the analytical evaluation of the means, ends and consequences of security measures’⁸⁰. Simply put, we cannot and should not avoid normative judgements when we study security.

For Ciută, a ‘prescriptive observation’ endorsing a particular concept/practice of security because it is considered to be “better”, ‘cannot therefore be justified analytically, but only normatively’⁸¹. This is an important distinction. He thus suggests that rather than endorsing a particular version of security from an analytical perspective, which is problematic, the analyst can engage normatively by highlighting ‘the ethical implications of different contextual definitions of security’⁸². Thus, he stresses a normative *awareness* as opposed to fixed normative commitments. This has important consequences for understanding the value of security. We can study actors’ different understandings and practices of security and what these do, considering their ethical implications in the context studied. McDonald critiques the traditional focus on the state, suggesting that if we recognise the contextual and contested

⁷⁷ Bubandt, "Vernacular Security: The Politics of Feeling Safe in Global, National and Local Worlds," 291.

⁷⁸ Ciută, "Security and the Problem of Context: A Hermeneutical Critique of Securitisation Theory," 314.

This also raises the question of the possible dissolution of security if security can mean whatever actors want it to mean: there is not space to go into this in depth here, but Ciuta deals with it in more detail (see 2009: 320-22).

⁷⁹ Ibid., 322.

⁸⁰ Ibid., 323.

⁸¹ Ibid.

⁸² Ibid., 323-4.

nature of security we need to study how actors beyond the state use it too – particularly since non-state actors often contest dominant security practices. If we are trying to understand security by studying how security is used, therefore, we cannot justifiably ignore alternative voices. Most importantly, focusing just on the state reifies a particular state-centred logic of security, which is often explicitly rejected by other actors⁸³.

So where do we look for security?⁸⁴ I have already suggested security practices as a starting point. Authors used here focus largely on discourse, while this paper suggests going beyond that to consider practices more broadly. Thus, at its most basic, we should start by looking at actual security practices in a particular context and asking what they *do*. I have emphasised the need for detailed empirical enquiry to see how different actors use security in different contexts and how individuals experience it, asking what different security practices *do*, what actions and habits they produce, and how they affect life experiences. Situated in-depth case studies lend themselves most obviously to such analysis of the value of security. They are also more likely to provide situated and practically useful knowledge. Bubandt's study of security practices in Indonesia is an excellent example here: he analyses how state and global security notions/structures are contested or absorbed at local levels, and how local notions feed back into both. While the focus in his study is on the meaning of security the methods could be equally useful for studying its value. An analysis could study global, state and/or non-state security practices, considering both more 'high profile' practices with a lot of influence and marginalised or 'smaller' everyday security practices⁸⁵. This necessarily needs to include a consideration of power: where it lies and how this is reproduced. Thus, a contextualised and practice-centred approach to the value of security looks at how different

⁸³ McDonald, "Securitization and the Construction of Security," 575.

⁸⁴ I draw loosely on McDonald's framework here, developed in *Security, the Environment and Emancipation*, 24-35.

⁸⁵ See Jef Huysmans, "What's in an Act? On Security Speech Acts and Little Security Nothings," *Security Dialogue* 42, no. 4-5 (2011).

actors understand and practice security and analyses what these different understandings and practices of security do. The following questions may be useful when undertaking such an analysis:

- Who are the key actors?
- Who is empowered to practice security and who is not?
- How do different actors represent security?
- What practices do they undertake, what do they do?
- What do they emphasise or call for?
- What do they want to protect, how and from what?
- What does the practice aim to do, and what does it do?
- What effects do the practices produce?
- What actions and habits do they produce, and how do they affect life experiences?
- Are they helpful in daily struggles (the pragmatist test)?
- Do they protect, enable or constrain referents?
- What are the ethical implications of the practices studied?

This is not an exhaustive list but it does provide a starting point. The answers to these questions will vary in different contexts. Which actors/practices are important to study will also depend on the project and case/s studied. We also need to recognise the interconnectedness of security issues⁸⁶. For example, a security practice may be helpful to the daily struggles of *some* but produce insecurity for others. Thus, the wider ethical implications of the practices analysed need to be taken into consideration.

⁸⁶ Audra Mitchell, "Only Human? A Worldly Approach to Security," *ibid.* 45, no. 1 (2014).

We are also left with the normative problem of which actors we choose to study: which practices do we study, whose voices do we listen to, and why? Pragmatism does not give satisfying answers to questions about power: whose daily struggles should practices be helpful to, and who gets to decide if the results of a practice are good? McDonald pursues a normative agenda drawing on emancipation, concerned with 'locating immanent possibilities for emancipatory change' by opening space for alternative voices⁸⁷. While I am sympathetic to this approach, it is worth remembering that alternative is not necessarily 'better' in ethical terms: consider right-wing groups using security to advocate for closing EU borders to refugees escaping war, for example. So who do we listen to and study, and on what basis do we make this decision? In most cases and contexts studied, there will be a range of actors practicing and articulating security. Covering a range of actors will help to capture different ways of practicing security, which will then allow for more depth when we consider the ethical implications of these security practices. This doesn't mean all studies have to cover all actors: a study could focus on a single state, non-state groups, or one or more international organisation/s: but in each of these there will likely be some contestation, resistance and disagreement. By analysing how security is contested in different spaces, we also recognise that security is a 'situated interactive activity'⁸⁸ and needs to be understood, and studied, as such.

To give another example, Bilgic studied security in Tahrir square, focusing on how protesters experienced and practiced security during one week. He draws on feminist work to rethink emancipation, emphasizing how 'individuals and social groups' themselves articulate security:

⁸⁷ McDonald, *Security, the Environment and Emancipation*, 4.

⁸⁸ Thierry Balzacq, "The Three Faces of Securitization: Political Agency, Audience and Context," *European Journal of International Relations* 11, no. 2 (2005): 171.

‘that is, their own expressions of how security is understood by them’⁸⁹. A similar approach could be used to understand the value of different security practices in such a case. Looking at gender, resistance and human security, Hoogensen and Stuvoy suggest that ‘the way to understand and to establish knowledge about security in empirical terms is to enter people’s life-worlds and access local experiences of in/securities’⁹⁰. These examples both emphasise smaller scale security practices and experiences of security, but studies could equally analyse how different actors within the United Nations practice security within that institutional setting and the value of such practices, for example. My own work has looked at how different actors within the United States and China practice energy security, and the value or ethical implications of different security practices in this context⁹¹.

The introduction to this article noted the importance of considering the role of the analyst in normative analysis. A pragmatic focus on practice partly removes this problem, by focusing on detailed empirical enquiry as opposed to imposing analytical criteria for what makes particular security practices ‘good’ or ‘bad’. In particular, focusing on individuals’ (or groups) own articulations of security⁹², and evaluating these normatively. However, we cannot fully avoid normative judgement, which is where Ciută’s emphasis on normative awareness and reflexivity is useful. Reflexivity and positionality requires acknowledging the role of the researcher in the research process and in interpreting the data⁹³. Security analysts are not neutral, and will always arrive with preconceived ideas and opinions about the concept and value of security. This only makes openness about normative commitments more important

⁸⁹ Ali Bilgic, “‘Real People in Real Places’: Conceptualizing Power for Emancipatory Security through Tahrir,” *Security Dialogue* 46, no. 3 (2015): 273; Gunhild Hoogensen and Svein V. Rottem, “Gender Identity and the Subject of Security,” *ibid.* 35, no. 2 (2004).

⁹¹ Jonna Nyman, “Rethinking Energy, Climate and Security,” *Journal of International Relations and Development* forthcoming (2016); “Energy and Security: Discourse and Practice in the United States and China [Phd Thesis],” University of Birmingham, <http://etheses.bham.ac.uk/4918/>.

⁹² For example, see Hoogensen and Rottem, “Gender Identity and the Subject of Security.”

⁹³ See Peregrine Schwartz-Shea and Dvora Yanow, *Interpretive Research Design: Concepts and Processes* (New York and London: Routledge, 2012), 100.

so these can be recognised and interrogated. The role of the security analyst is always political: the key is ‘to be aware of [and explicit about] the political significance of analysis’⁹⁴. The normative commitments of the analyst will also likely vary between cases studied in contextual security analysis. For example, in my analyses of energy security practices I emphasise the connections between human well-being and environmental security, for the simple reason that without environmentally sustainable energy security practices in the longer term there will be no individual experiences, no human well-being to consider, no daily struggles to be helpful to, as the planetary ecosystems on which human survival depend will collapse. What is ‘good’ therefore depends on the context and what different security practices do in that context, as well as the analyst. This is why we need to be clear and open about normative commitments. Recognising the subjective and context-dependent nature of the value of security will in turn fuel and forward the debate instead of getting gridlocked in debates over the impossibility of an objectively defined ‘good’.

However, a pragmatist frame also recognises the need to keep these categories open. So how do we determine what is and isn’t security, and thus which practices to study? The focus here is on analysing how security is used and using this to further understanding of the value of security. Thus the focus is on studying existing security practices, and what they ‘do’ in different empirical contexts – taking a broad interpretation of ‘practice’. Here I mean specifically practices undertaken in the name of security⁹⁵. This doesn’t mean security couldn’t be something else, or that there aren’t further things that could or should be secured (which currently are not), but the focus here is on how different *existing* practices of ‘security’ in empirical contexts can help us understand the value of security. Here, I argue in favour of

⁹⁴ Johan Eriksson, "Observers or Advocates?," *Cooperation and Conflict* 34, no. 3 (1999): 327.

⁹⁵ That said, this is a personal preference intended to help narrow down the number of practices studied, but it is not inconceivable that the framework could also be used to study practices that practitioners *don't* consider to be part of security.

pluralism and diversity: rather than narrowing down what we mean by ‘security’ to very specific uses or particular (elite) actors, looking at a more diverse range of actors and a more diverse range of meanings of security (beyond survival), serves to illustrate that the value of security depends on the context.

Security studies needs to open up for the possibility that ‘security’ can mean very different things, and that in these cases it is characterised by very different processes and outcomes. Similarly, it is important to view the value of security in non-binary terms. Security is contested: consequently, to understand security it is necessary to study the full range of security constructions – from more problematic and undesirable security practices, to limited practices which secure us from threat, to more emancipatory practices, by a wide range of actors and in a range of empirical contexts, to really interrogate the value of security. In a sense this means accepting the range existing definitions and approaches to the value of security and studying how they work in practice.

	Analytic frame	Normative frame	Pragmatist frame
Origins	Berlin and Galtung’s respective notions of negative/positive liberty and peace	Moral philosophy, or consequentialism	Negative/positive debate, pragmatism, practice theory and contextualism
Key features	Negative and positive <i>work together</i> to provide ‘complete’ or ‘true’ security. Positive security here often centres on the individual.	Negative security as bad and to be avoided, positive security as a good thing to strive for.	Focuses on how security works in context to understand when it is ‘good’ and ‘bad’ and best avoided based on human experience.
Definitions	Negative security here involves	Clear criteria are used to	Negative security is bad and

	the absence of threat (a lack, which makes it negative), and positive security includes both the absence of threat <i>combined with</i> the presence of conditions furthering human ‘flourishing’ of some form – it is the <i>presence</i> of these conditions which make it positive, grammatically. Thus positive security can here be seen as ‘security plus’, providing ‘complete’ or ‘true’ security.	determine which characteristics, features or consequences define negative and positive security, based on the value judgements of the analyst. Understandings of negative security often draw on securitization, emphasising non-democratic emergency processes and state-centric threat/defence thinking.	to be avoided, positive security is good and desirable, but what is good or bad is contingent and so the value of security depends on the context. Analyses how security is used in practice by a wider range of actors, studying its processes and consequences to determine its value in different empirical contexts.
Role of the analyst	Objective observer of value, often also advocating for positive security.	Moral arbiter	Observing how security works in empirical contexts to determine value. Stresses normative awareness and reflexivity.
Key examples	Booth’s use of ‘emancipation’, Hoogensen Gjörv, Roe	Morally just and unjust securitization (Floyd)	

Figure 2: Different uses of negative and positive security

Implications and conclusion

The value of security matters: both because problematic security practices can do a lot of harm and because ‘good’ or ‘positive’ security practices can help us advance towards the kind of world that we want. However, the current debate over the value of security causes confusion. This paper has clarified the debate by separating out two different ‘frames’ used by key authors. The analytic frame draws on positive/negative liberty and peace, and thus

defines negative security as the absence of threat, and positive security as added enabling possibilities beyond survival: here positive and negative security work together. The normative frame uses value judgements and deploys the terms positive and negative in a normative sense, often drawing on securitization theory. Consequently, this frame suggests that negative security is bad and to be avoided, while positive security is desirable. These frames have their roots in different literatures and although both theorise the value of security they look at different aspects, leading to somewhat different research agendas. This causes confusion and has stalled the debate.

This paper has argued that the value of security depends on how it is used in different empirical contexts, developing a pragmatic framework for understanding the value of security in context. This approach allows us to recognise that security can be bad, but that it can also be something worth striving for, while avoiding imposing abstract theoretical definitions of 'good' and 'bad'. Bourne and Bulley suggest abandoning attempts to establish secure ethics, arguing that we should instead be 'treating moral choice as explicitly unsure, uncertain and insecure'⁹⁶. Accepting this, a pragmatist frame helps us move forward with a practical research agenda that avoids defining the 'good' in theoretical terms while allowing us to evaluate the normative implications of different existing security practices in a particular context. Thus the paper opens space for empirically grounded research on the value of security.

The paper focuses on clarifying the existing debate and suggesting an alternative, so it presents a conceptual analysis rather than an empirical application. There is therefore much potential for future research on the value of security in different contexts. Beyond this, two

⁹⁶ Mike Bourne and Dan Bulley, "Securing the Human in Critical Security Studies: The Insecurity of a Secure Ethics," *European Security* 20, no. 3 (2011): 455.

problems caused by this framework that require further research come to mind. Firstly, what about cases where some experience security as a good, but others do not? The ongoing debate over the surveillance society provides an excellent example: some experience surveillance as reassuring, while others find it an imposition on their freedom to go about their daily lives unwatched. In such cases the role of the analyst becomes much more complicated and needs to be considered in more depth. Secondly, what about those who cannot practice security? This framework is merely intended to understand the value of different existing security practices. More research is needed into the silences and gaps this creates, as it overlooks those who cannot speak or practice security but may be deeply affected by insecurity, whether this be silenced or marginalised groups or non-human elements in need of protection, such as local or global ecosystems. This paper has clarified the debate over the value of security and suggested a new framework for analysing it in context, but while it pushes the debate forward it also raises new questions. Security is powerful and contains potential for harm as well as ethical progress. Understanding the value of security is crucial in order to move towards the kind of world that we want.

Acknowledgements

This paper has evolved through several drafts, and many people have kindly read it and provided helpful comments at different stages. I need to thank the anonymous reviewers and Editors for their constructive and helpful feedback throughout the submission process. Andrew Neal, Matt McDonald, Lene Hansen, Anthony Burke, Kacper Szulecki and Olaf Corry have all provided valuable comments on earlier drafts. Thanks also to Adam Quinn, Rita Floyd and Liam Stanley for helping me to figure out what I wanted to say.
