*Comparisons of the three types of ventilation using chi square, ANOVA or Kruskal-Wallis statistics; **Chi square for distributions among all gestational ages classes within the three types of ventilation. ***Chi square for comparisons of different modes of administration among the three types of ventilation.

†The CRIB score is a measure of illness severity in neonates. It consists of 6 items collected in the first 12 hours after birth. It ranges from 0 to 23 where higher scores indicate higher clinical risk

¶ 26 infants were intubated immediately upon arrival in the unit and thus were included in this group

|| Data collection was stopped on the 28th day of hospitalization.

¶For tracheal ventilation group, time on non-invasive ventilation (NIV) or spontaneous ventilation (SV) refers to NIV use or SV before tracheal intubation or after extubation. For NIV group, time on spontaneous ventilation refers to the periods of spontaneous ventilation before or after NIV use.

‡Continuous and/or bolus

|||Some patients received more than one type of analgesic or sedative

§From these 1764 neonates, 1707 (96.8%) received morphine (n=1016) and/or fentanyl (n=694) and/or sufentanil (n=227).

§§The highest level of ventilation during the study period classified patients into three groups: tracheal ventilation, non-invasive ventilation and spontaneous ventilation

††Information available for 2138 neonates in the tracheal ventilation group, 1493 in the non-invasive ventilation group and 3017 in the spontaneous ventilation group

Abbreviations: NA= non applicable; SD: Standard Deviation; IQ: Interquartile

|| Any form of sedation analgesia includes opioids, sedatives-hypnotics, general anesthetics, Nonsteroidal Anti-inflammatory Drugs, local anesthetics and others.

§ Opioids, sedatives-hypnotics or general anesthetics drugs include all opioids, ketamine, benzodiazepines, propofol, barbiturates, chloral hydrate and other sedatives. Comparaison against no analgesia/sedation or other types of analgesia.

*Reference category

†Odds ratio per point increase in CRIB score. The CRIB score is a measure of illness severity in neonates. It consists of 6 items collected in the first 12 hours after birth. It ranges from 0 to 23 where higher scores indicate higher clinical risk.

‡Patients were classified in 3 groups according to the highest level of ventilation they received during the study period

¶ Area with 95% confidence interval (0.5 = no predictive value; 1.0 = perfect prediction)

¶¶An internal validation of the model was performed using a bootstrap approach (1000 samples)

§§ Odds ratio per point increase in APGAR score. This score ranges from 0 to 10

Abbreviations: CI: Confidence interval; SD: Standard Deviation ; NA: Non applicable; IUGR: intrauterine growth retardation

*Reference category

†Odds ratio per point increase in CRIB score. The CRIB score is a measure of illness severity in neonates. It consists of 6 items collected in the first 12 hours after birth. It ranges from 0 to 23 where higher scores indicate higher clinical risk.

‡Patients were classified in 3 groups according to the highest level of ventilation they received during the study period

¶ Area with 95% confidence interval (0.5 = no predictive value; 1.0 = perfect prediction)

||An internal validation of the model was performed using a bootstrap approach (1000 samples)

§§ Odds ratio per point increase in APGAR score. This score ranges from 0 to 10

Abbreviations: CI: Confidence interval; SD: Standard Deviation ; IUGR: intrauterine growth retardation

Table 3. Univariate analysis and multivariable linear model of factors associated with longer duration of tracheal ventilation

	Number of neonates	Univariate analysis		Number of neonates	Linear model **	
		Mean (SD) duration of tracheal ventilation, h	P value		β (95% CI)	P value
